

Main Features – Important update!

- WebIQ 2.15.0 erroneously only utilized **unencrypted** connections to the OPC-UA server, unfortunately. Because a fallback to unencrypted connections happened by default we have both fixed the initial issue and changed the way encryption is handled.
- **BREAKING CHANGE** If you have been using unencrypted connections to your OPC UA server and you want to keep using unencrypted connections after updating to WebIQ 2.15.1 you have to manually modify the IO Handler configuration in the IO Manager by setting both *Message Security Mode* and *Security Policy* to *None* manually, otherwise WebIQ will support encrypted connections to the OPC UA server only and you might not be able to access items from the server until you change this setting.
- **In general we recommend to only use encrypted connections to the OPC UA server**
- **Please note that this release only updates the OPC UA IO Handler, there are no changes in WebIQ Server, WebIQ Designer and WebIQ Visuals so these will still be shipped in version 2.15.0**

WebIQ Visuals

- No change
- Still version 2.15.0

WebIQ Designer

- No change
- Still version 2.15.0

WebIQ Server

- WEBIQ-3977 IO Manager: Message Security Mode 'automatic' no longer contains 'none' so it will not fallback automatically to non-encrypted communication if encryption fails
- WEBIQ-3975 Fix: WebIQ 2.15.0 did not support encrypted connections to OPC-UA servers anymore and tried to fall back to unencrypted connections, see WEBIQ-3977
